

**THINGS**

# Things : Profile

For ThingsRecon the Digital Footprint is not just about IPs and Subdomains.

It's all that relates to them which is important to find and monitor. This way we created the concept of an ID card which shows your profile and relations.

## Things : Category

Categories help us make sense of the world, and they are equally important in the digital realm. With the introduction of the «Things Category », we're bringing the principles of categorization to your data. It allows you to group your information based on what it is and the associated risks or attributes, enabling you to create a structured framework for comprehending your data's complexities.

## Things : Relation

Mapping relationships between your data through the «Things Relation» feature is a game-changer. It not only provides a structured framework for understanding your information but also helps you make more informed decisions, gain a deeper understanding of your data, and enhance your security by quickly identifying potential attack vectors.

# AI image Recognition

We're excited to introduce a groundbreaking feature, AI image recognition, that sheds light on your digital presence, recognizing how you paint your online identity with unprecedented accuracy. This transformative technology deciphers the intricacies of your online footprint by analyzing images and visual content associated with you, making the process of understanding and managing your digital persona more precise than ever.

## Detection Enhancement

Our innovative « Things » approach redefines reconnaissance, leaving traditional methods in the past. By adopting forward-thinking principles, we've elevated detection to new levels, offering insights beyond traditional means.
